

Roadmap - Topic 9 Reproduction and Growth (Genetics)

Learning Objectives	Vocabulary	Questions
Lesson 1: Patterns of Reproduction		
- how organisms reproduce either sexually or asexually and how these reproductive processes result in the transfer of genetic information to their offspring - the inheritance of half of an offspring's genes from each parent and how this leads to variations in traits	Asexual reproduction Sexual reproduction Fertilization Mitosis Meiosis	Trait Gene Inheritance Allele Dominant allele Recessive allele Offspring
Lesson 2: Patterns of Inheritance		
- Gregor Mendel's contributions to the fields of genetics and inheritance - how variations of traits between parents and offspring arise from variations between genes from each parent	Heredity Pollination Probability Purebred Hybrid	Genotype Phenotype Punnett square
Lesson 3: Plant Structures for Reproduction		
- reproductive strategies of plants - identify aspects of the text that lead to conceptual understanding of plant reproduction and seed dispersal - illustrate the structures that enable plant reproduction	Cones Ovule Fruit Germination Pistil Ovary	Gymnosperms Angiosperms Stamen Anther Pollen
Lesson 4: Animal Behaviors for Reproduction		
- how animals use behavior to increase chances of survival and reproduction	Behavior Instinct	Mating system Migration

- convey information about types of mating systems - compare animal migration patterns with human movement patterns	Pheromone		
Lesson 5: Factors Influencing Growth			
- environmental and genetic factors that influence an organism's growth - methods to stimulate plant growth	Hormone Auxin Tropism Dormancy		4. How
